

Be Mobile

The CamMobile Series by HeiTel: DVR for Use in Transport Vehicles

In its new CamMobile series, HeiTel is introducing a DVR for use in transport vehicles (e.g. armoured vehicles) as well as local public transport. Like the CamDisc^{SVT} series, this new gen-

Control centre integration

Like all HeiTel products, the CamMobile series is also compatible with higher-ranking control centres that are equipped

eration of equipment has 4 or 10 video inputs and, as well as some important additional functions, has all of the proven features of the successful svr range.

So, coupled to the vehicle electrical system, recording takes place on a special 2.5" removable hard disk, tailored to mobile use through shock-resistant bearings. The varying voltage input of 8 to 40 V DC ensures that the CamMobile series can be operated directly using the voltages standard in vehicles. At the same time, an integrated voltage transformer provides a central and economical supply of 12 V DC/350 mA for all of the cameras installed in the vehicle.

For live image transmission, image evaluation and parameterization, CamMobile has an Ethernet interface and an additional multi-standard interface, tailored for wireless communication, for the connection of external adapters, particularly suitable for efficient image transmission to standardised mobile networks.

with receiving software from the CamControl software family.

The newly developed HeiTel Event Management System is available should a number of properties or large vehicle fleets need to be managed efficiently from a central office. Video management tailored to the features of HeiTel products, dynamic alarm management, freely de-

finable action plans and a database structure that has been perfected for control centre applications are just a few of the performance features of this multi-station software.

HeiTel SDK, a powerful development environment, is available for individual and tailormade integration of HeiTel products into higher-ranking control centre software packages.

Flexibility is the ace in the hole

HeiTel is now offering all svr series users a free firmware upgrade for rapid, platform-independent access from PC, smartphone and PDA browsers. The svr series and CamMobile, will be factory-supplied with a web server designed for security applications. Although the multi-station browser interface manages without ActiveX elements or other costly plugins, all of the important functions, such as live image transmission, camera switching, multi-image display, image quality settings and the

control of all notable PTZ systems are available to the user at any time and in any location.

At regular intervals, HeiTel offers useful additional functions that can be installed easily, and even remotely, in the on-site image transmitters. These functions are as different as the HeiTel product applications. Consistent with company philosophy, compatibility and stability always remain at the forefront. Current upgrades include freely-parameterizable "privacy zones", the tried and tested Offline Player, now also with a full range of functions for online evaluation using Motion Search, flexible integration of PTZ systems using the newly developed "Generic Protocol", CamControl PRO with audio recording and up to 9 simultaneous connections to different objects, as well as flexible data security for all project-specific configuration data.

Firmware upgrades are available to all interested parties, on www.heitel.com, in the section "Service/Upgrades".
